## 3.33pt

# Security and Protection

René Serral-Gracià<sup>1</sup>

<sup>1</sup>Universitat Politècnica de Catalunya (UPC)

February 11, 2022

## Lectures

- System administration introduction
- Operating System installation
- User management
- Application management
- System monitoring
- Filesystem Maintenance
- Local services
- Network services
- Security and Protection
- Virtualization

## Outline

- 3.33pt
- Introduction
  - Goals
- About security
- Security components

### Goals

### Knowledge

- Main aspects of system's security
  - Local security
  - Network security
- Network services security

#### **Abilities**

 Installation, execution and analysis about the results of security auditing tools

## Outline

- 3.33pt
- Introduction
- 2 About security
- Security components

# What does security mean?

- Confidentiality
  - Protection against undesired data access
- Integrity
  - Protection against unwanted destruction modification, data loss
- Availability
  - System must be up and running for legitimate users
- Consistency
  - Avoid unwanted changes to system behavior
- Isolation
  - Avoid unauthorized access to external people (hackers)

## Perfect security?

- There is not such a thing
  - Even if the machine is down
  - With enough resources (time, money, ...) everything is hackable
  - Natural disasters

Goal: get a "secure enough" system

- Secure against automatic attacks (script kiddies)
- Easy to be back up and running

# Security and usability

### Normally two sides of the same coin

- Highest security, lowest usability
  - Limited access to services and apps
  - Constant identifications
    - Burdensome to the users
    - Slow and tiring
- More usability means less security

## Too much security can have the opposed effect

- Users write all their passwords in a post-it
- Use tools to automate resource access

# Goals in attacking a computer

- Get information
- Get/destroy data
- Denial of Service
- Obtain resources
- Use machines as proxy to other attacks (DDoS)

## Some attacks

- Obtain passwords
- Filesystem abuse
- Unexpected parameters
- Buffer overflows
- Race conditions
- Resource abuse
- Troyan, Viruses, . . .
- Port scanning

- Spoofing: IP, DNS, ARP,
- Man-in-the-middle
- Sniffers
- Worms, . . .
- Social Engineering
- ...

## **Outline**

- 3.33pt
- 1 Introduction
- About security
- Security components
  - Physical Security (I)
  - Local Security
  - Network Security

# **Physical Security**

- Physical access to the console
  - Reboot with a system disk
  - Data stealing (hard drive, backups)
  - System alteration
  - Computer stealing
- Physical access to network cables
  - Network Monitoring
  - Denial of Service
- Physical access to the office
  - Look for passwords below the keyboard!
- Access to destroyed documents

# Physical Security (II)

- Sometimes it doesn't take a malicious attack to destroy data
  - Accidents: power shortages, fire, ...
  - Ambient conditions: temperature, humidity, . . .
  - Natural catastrophes: hurricanes, earthquakes, ...

Security

- Other: bugs, food, beverages, . . .
- Sensors, special materials, raised floor, ...

# **Local Security**

Goal: protect against attacks form the users of the system

- Attacker has a non privileged user account
- Even a privileged one
- Users willing to escalate privileges
- Protect the system locally before connecting it to the network

## **Passwords**

- Enforce a strong password policy
  - Long passwords (+8 characters)
  - Mix of numbers, letters, and special characters
  - Hard to guess
  - Easy to remember
  - NOT a dictionary word or variation
- Password expiration policy
  - Be careful it can become quite annoying
- Check password strength on each change/periodically
- Protect encrypted passwords (/etc/shadow)

Introduction

# Permission and protection

### Minimum access policy

- An user should not access a file he/she doesn't need
- Grant the minimum privileges and ...
  - assign more under demand
  - Grant only group level permissions
- Assign a sensible file creation mask

```
umask 027 (rwx r-x ---), 022 (rwx r-x r-x)
```

- Be aware of potentially dangerous files
  - with SetUID bit
  - Holding system configuration

## Resource abuse

- Excessive use of resources by a single user
  - CPU/processes
  - Memory
  - Disk
- Set up limits and quotas
  - /etc/security/limits.conf
  - ulimit
  - disk quotas

17

# Filesystem integrity

- Often attackers modify the filesystem to hide the attack
  - Modification of log files
  - Rootkits
- Tools to detect changes in the filesystem
  - Through digital signature of files
- Partition/Devices in read-only

Security

# System Logs

- May contain information about the attacks
  - Permit to know if a system has been compromised
  - Post-mortem analysis
- Unsecure to store them on the same server
  - Better in a remote server
  - Print them?

## Local security - Example

### • tiger: security auditing tool

```
S sudo tiger
Configuring ...
Will try to check using config for x86_64 running Linux 3.6.8...
-- CONFIG-- [con005c] Using configuration files for Linux 3.6.8. Using
           configuration files for generic Linux 3.
Tiger security scripts *** 3.2.3, 2008.09.10.09.30 ***
11:21> Beginning security report for asuso.lomillor.org.
11:21> Starting file systems scans in background ...
11:21> Checking password files...
11:21> Checking group files...
11:21> Checking user accounts...
11:29> Checking .rhosts files...
11:29> Checking .netrc files...
11:29> Checking ttytab, securetty, and login configuration files ...
11:29> Checking PATH settings...
11:30> Checking anonymous ftp setup...
11:30> Checking mail aliases...
11:30> Checking cron entries...
11:30> Checking services configuration...
11:30> Checking NFS export entries...
11:30> Checking permissions and ownership of system files...
11:30> Checking for indications of break-in...
11:30> Performing rootkit checks...
11:37> Performing system specific checks...
12:12> Performing root directory checks...
12:12> Checking for secure backup devices...
12:12> Checking for the presence of log files...
12:12> Checking for the setting of user s umask...
12:12> Checking for listening processes...
12:12> Checking SSHD s configuration...
12:12> Checking the printers control file...
12:12> Checking ftpusers configuration...
12:12> Checking NTP configuration...
12:12> Waiting for filesystems scans to complete ...
12:12> Filesystems scans completed...
12:12> Performing check of embedded pathnames...
12:14> Security report completed for asuso.lomillor.org.
Security report is in /var/log/tiger/security.report.hostname.121204-11:21
```

## Exercise

Which issues might present if an attacker modifies the environment variables? (i.e., PATH)

# Network Security

Goal: Protect against attacks coming from the outside

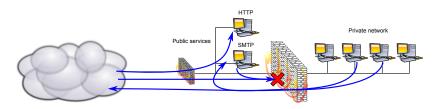

- Aimed at:
  - The services we are offering
  - The network itself
  - The information our servers is keeping

## **Network Security**

- Mandatory to use firewalls
- Two level security: Protected vs DMZ

## Offered services

### Security level depends on the offered services

- System and user information
  - finger, rdate, rusers, ...

- Remote login and connection
  - telnet, rlogin, rsh, ...
- File and data sharing
  - NFS, Samba, LDAP, FTP, HTTP, ...
- E-mail

# Network security

### Minimum access policy

- Disable all the services
  - Or even uninstall them
- Enable only the required services
  - and limit the access only to current users

Validate the configuration of the installed services

Even if disabled

# **Network security**

#### Monitor the activity of the installed services

• nmap: list running services

```
$ nmap 10.1.1.1
Starting Nmap 6.00 ( http://nmap.org ) at 2012-12-04 12:03 CET
Nmap scan report for 10.1.1.1 (10.1.1.1)
Host is up (0.00031s latency).
Not shown: 989 closed ports
PORT
      STATE SERVICE
22/tcp open ssh
25/tcp open smtp
111/tcp open rpcbind
139/tcp open netbios-ssn
445/tcp open microsoft-ds
631/tcp open ipp
2049/tcp open nfs
3306/tcp open mysql
5900/tcp open vnc
8080/tcp open http-proxy
9090/tcp open zeus-admin
```

Introduction

- Who has acces to what services?
- How to validate user identity
  - Through IP addresses? → IP Spoofing
- Reverse DNS → DNS Spoofing
- User level authentication, digital certificates, . . .
  - Service forwarding

```
ssh -R 12443:10.1.1.10:443 rserral@gw.ac.upc.edu
ssh -L 443:gw.ac.upc.edu:12443 rserral@10.1.1.10
```

Kerberos

### Kerberos

#### Protocol used for network authentication

- Based on Secret key cryptography (password)
- Kerberos server is used as identity proof
  - Client contacts Key Distribution Center for a ticket
    - KDC encrypts a ticket using client's passwd
    - Client gets the ticket
  - The ticket enables access to specific services
- Transparent for the user

# Intrusion Detection Systems (IDS)

- Network based
  - Traffic analysis to search for attacks
- Host based
  - System activity to search for attacks
    - logs, filesystem, . . .

# Security through obscurity

- Not a very good security policy
  - Offers a false sense of security
- Added security on an already secured environment
- Examples
  - Change web server version
  - Change default ports for applications

# Contingency plan

### Actuation protocol in case of system failure

- What to do?
- Who to notify? Using which information?
- It must be defined for each failure
  - Service failure
  - Hardware failure
  - Data center collapsing
- Do simulations to prove its usefulness
- Accordingly to company policies

# Security tools

- Local system configuration
  - titan
  - tiger
- Network system configuration
  - nmap
  - nessus
- IDS
  - tripwire
  - snort
  - locgcheck

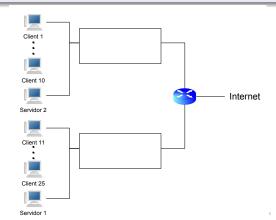

## Some advice

- Never be overconfident
  - There is always someone smarter
- Be somewhat paranoid
- Be prepared for the worst
  - Backups
  - Virtualization
- Run attacks to your systems
  - Better yet from the outside
- Be up to date
  - Security evolves constantly
  - Security forums, newsletters, . . .

### Activitat

- De la xarxa vista al final del tema de Xarxa indica:
  - On posaries el (o els) firewall
  - Quines consideracions tindries a l'hora de configurar-los

## Activitat

### **Preguntes**

- Indica si compraries algun equip m\(\tilde{A}\)\(\tilde{\text{C}}\)s a part dels equips de xarxa anteriors
- Distribueix els serveis entre tots els servidors
- Indica on instal·laries el (o els) firewall i quins criteris seguiries per configurar-los
